

MM BEATS LIMITED – SOC INCIDENT TICKET

Ticket ID: SOC-002

Incident: Suspicious Remote Access to HR-PC01

Status: Escalated– Pending Validation

Alert Details

Date: 03 October 2026

Alert Time: 18:02:21

Affected Endpoint: HR-PC01

Affected User: mel

SIEM: Wazuh

Detection Source: Windows Security Event Log

Alert: Successful Remote Logon Detected

Windows Event ID: 4624

Wazuh Rule ID: 92657

Rule Level: 6

Triage / Investigation

The alert was reviewed in Wazuh to determine the source of the successful remote logon. Windows Security logs showed that the **mel** account successfully logged on to **HR-PC01** using **Logon Type 3 (Network)** and **NTLM authentication**.

Further investigation identified the source IP address as **192.168.1.155**, which belonged to the **BLACKWOLF** machine. The remote access was treated as suspicious and required further validation.

Analyst Assessment

The activity was assessed as suspicious. The mel account was successfully used to remotely access HR-PC01 from **BLACKWOLF (192.168.1.155)**. The source machine was not recognized as authorised to access the HR endpoint, indicating potentially unauthorised remote access.

Action Taken / Containment

A suspicious remote access was identified and documented. No containment action was performed during the lab simulation. In a real SOC environment, the affected user would be contacted or the activity verified through the appropriate process. If the user confirmed the activity was not authorised, the incident would be escalated and immediate containment recommended, including resetting the affected account credentials and blocking further unauthorised access.

Escalation

The suspicious remote logon was documented and escalated to the Tier 2 / Incident Response team for further investigation. Evidence including the successful network logon, source IP address **192.168.1.155**, and source workstation **BLACKWOLF** was attached to the case. Further validation is required to determine whether the **mel** account was compromised and whether any additional systems or resources were accessed.
