

MM BEATS LIMITED – SOC INCIDENT TICKET

Ticket ID: SOC-003

Incident: Brute-Force Login Attack Against HR-PC01

Status: Escalated– Successful

Authentication Detected

Alert Details

Date: 06 October 2026

Attack Activity: 20:06:57 – 20:07:08

Affected Endpoint: HR-PC01

Affected User: mel

Source Host: BLACKWOLF

Source IP: 192.168.1.155

SIEM: Wazuh

Detection Source: Windows Security Event Log

Failed Authentication Event: Windows Event ID 4625

Successful Authentication Event: Windows Event ID 4624

Triage / Investigation

The authentication activity on HR-PC01 was reviewed in Wazuh. Multiple failed login attempts were identified against the **mel** account, generating Windows Security **Event ID 4625**. The attempts originated from **192.168.1.155 (BLACKWOLF)** and used **NTLM authentication with Logon Type 3 (Network)**.

The failed attempts were followed by a successful authentication for the same account from the same source, recorded as Windows Security **Event ID 4624**. Wazuh subsequently generated a **Successful Remote Logon Detected** alert.

The sequence of repeated authentication failures followed by a successful login was assessed as consistent with a successful brute-force login attempt.

Analyst Assessment

The activity was assessed as a **True Positive**. Multiple failed authentication attempts against the **mel** account from **BLACKWOLF (192.168.1.155)** were followed by a successful network logon from the same source.

This indicates that valid credentials were successfully used after repeated failed attempts. No post-login activity was performed or observed during the lab simulation, so no further account or endpoint activity was confirmed.

Action Taken / Containment

The brute-force activity and successful authentication were documented for escalation. No containment action was performed during the lab simulation.

In a real SOC environment, immediate containment would be recommended due to the successful authentication following repeated failed attempts. Recommended actions would include resetting the

affected user's password, terminating active sessions, blocking the suspicious source where appropriate, and reviewing the account and endpoint for additional activity.

Escalation

The incident was escalated to the **Tier 2 / Incident Response team** because repeated failed authentication attempts were followed by a successful login to the **mel** account.

Evidence provided for escalation included the failed authentication events, successful authentication event, affected endpoint **HR-PC01**, source IP **192.168.1.155**, and source workstation **BLACKWOLF**.

Further investigation was recommended to determine whether the account had been used for any additional activity and to confirm whether credential reset, session termination, or further endpoint containment was required.

Response Timeline

20:05:31 – Pre-attack timestamp recorded on BLACKWOLF.

20:06:57 – First failed authentication against the mel account on HR-PC01.

20:06:59 – Second failed authentication detected.

20:07:01 – Third failed authentication detected.

20:07:04 – Fourth failed authentication detected.

20:07:06 – Fifth failed authentication detected.

20:07:07 – Successful authentication recorded for mel from the same source.

20:07:08 – Wazuh generated the Successful Remote Logon Detected alert.

Triage Start: Not recorded during simulation.

Escalation Time: Not recorded during simulation.
